Let's deploy a website to Google Cloud: A beginner's guide to Continuous Development/Deployment

by ~~Sony Valdez~~ MrValdez

THIS TALK

- Is aimed at Beginners
- The topic is fundamental
- Python is used for the website, but any programming framework applies
- This include non-website applications such as AI

TWO FUNDAMENTAL REQUIREMENTS

- Version Control
- Docker

TWO FUNDAMENTAL REQUIREMENTS

- Version Control
  - Allows for collaboration between Developers
  - Allows for a running history of code

TWO FUNDAMENTAL REQUIREMENTS

- Version Control
  - Allows for collaboration between Developers
  - Allows for a running history of code
- Docker
  - Allows for repeatable and consistent deployment

WHAT IS CONTINUOUS DEVELOPMENT/ CONTINUOUS DEPLOYMENT (CI/CD)

- DevOps is responsible in setting this up
- The developers focus on code
- When they are ready, they push to the repository
- The CI/CD detects the push and makes a build
- When the build is successful, the website is updated

BUT ITS EASIER TO JUST DEMONSTRATE

- Run website locally (Show what it normally looks like)
- Dockerize the app
- Run website on Docker (Show that everything is normal)
- Show website online (Sample of what is already deployed)
  - https://talk-2026-gdg-1091654592870.asia-southeast1.run.app
- Make and push changes
- Show CI/CD

HOW IS IT DONE?

- cloudbuild.yaml
- Google Cloud Run
  - *{pray to the demo gods}*

QUESTIONS?

- Source code:
  - https://github.com/MrValdez/talk-2026-gdg
- Things to learn to improve your CI/CD:
  - Automated Unit Testing
  - Automated Security/Vulnerability checks
  - Minimize roles and permissions to only that's required
